Question 1

You did such a great job helping Julia with her last coding contest challenge that she wants you to work on this one, too!

The total score of a hacker is the sum of their maximum scores for all of the challenges. Write a query to print the hacker_id, name, and total score of the hackers ordered by the descending score. If more than one hacker achieved the same total score, then sort the result by ascending hacker_id. Exclude all hackers with a total score of 0 from your result.

Input Format

The following tables contain contest data:

Column	Type
hacker_id	Integer
name	String

- Hackers: The hacker_id is the id of the hacker, and name is the name of the hacker.
- Submissions: The submission_id is the id of the submission, hacker_id is the id of the hacker who made the submission, challenge_id is the id of

Column	Type
submission_id	Integer
hacker_id	Integer
challenge_id	Integer
score	Integer

the challenge for which the submission belongs to, and score is the score of the submission.

Sample Input

[Change Theme](#)

Language

MySQL

```
1  select h.hacker_id, h.name, sum(t.max_score) as total_score
2  from Hackers h
3  join (
4  select hacker_id, challenge_id, max(score) max_score from Submissions
5  group by hacker_id, challenge_id
6  ) t
7  on h.hacker_id = t.hacker_id
8  group by h.hacker_id, h.name
9  having SUM(t.max_score)>0
10 order by total_score desc, h.hacker_id;
```

Congratulations

You solved this challenge. Would you like to challenge your friends?

5 79034 Marilyn 580
```

Question 2

Julia asked her students to create some coding challenges. Write a query to print the `hacker_id`, `name`, and the total number of challenges created by each student. Sort your results by the total number of challenges in descending order. If more than one student created the same number of challenges, then sort the result by `hacker_id`. If more than one student created the same number of challenges and the count is less than the maximum number of challenges created, then exclude those students from the result.

Input Format

The following tables contain challenge data:

Column	Type
<code>hacker_id</code>	Integer
<code>name</code>	String

- Hackers: The `hacker_id` is the id of the hacker, and `name` is the name of the hacker.
- Challenges: The `challenge_id` is the id of the challenge, and `hacker_id` is the id of the student who created the challenge.

Column	Type
<code>challenge_id</code>	Integer
<code>hacker_id</code>	Integer

```
1  select h.hacker_id, h.name, count(c.challenge_id) as challenges_created
2  from Hackers h
3  join Challenges c
4  on h.hacker_id = c.hacker_id
5  group by h.hacker_id, h.name
6  having count(c.challenge_id) =
7  (select MAX(cnt) from ( select count(*) as cnt
8  from Challenges
9  group by hacker_id
10 ) t)
11 or count(c.challenge_id) in
12 (select cnt from ( select count(*) AS cnt
13 from Challenges group by hacker_id) t
14 group by cnt
15 having count(*) = 1
16 ) order by challenges_created desc, h.hacker_id;
```
